                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
"Cloning and characterization of human Siglec-11. A recently evolved risignaling that can interact with SHP-1 and SHP-2 and is expressed by RT signaling that can interact with SHP-1 and SHP-2; and is expressed by RT tissue macrophages, including brain microglia.";
RT J Biol. Chem. 277:24466-24474(2002).

CC -i- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,8-CC linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand composition in the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via their SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules. CC composition with prpN6/SHP-1 and prpN11/SHP-2 upon phosphorylation.

CC -i- SUBCHILULAR LOCATION: Type I membrane protein.

CC -i- TISSUE SPECIFICITY: Expressed by macrophages in various tissues
                                                                                                                                                                                                                                                                                                                                                                                      28-FEB-2003 (Rel. 41, Created)

SIMILARITY: Belongs to the immunoglobulin superfamily. SIGL
(SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.
SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          including Kupffer cells. Also found in brain microglia. DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This is involved in downmodulation of cellular functions as the termination of the immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HGNC:15622; SIGLEC11.

-!- DOMAIN: Contains an intracytoplasmic mottif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This mot is involved in downmodulation of cellular functions as the termination of the immune response.
-!- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLEC (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.
-!- SIMILARITY: Contains 1 immunoglobulin-like V-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    InterPro;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      dependent binding to cells. Preferentially binds to alpha2,3-linked sialic acid. Also binds to alpha2,6-linked sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface.

SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Name=3;

Intersine and intersine and adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, thymus, trachea, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, thymus, trachea, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, thymus, trachea, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, trachea, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and testis.

Intersine and bone marrow; it is lower expressed in thyroid, placenta, stomach, lung, adrenal gland, fettal brain and testis.

Intersine and testis.

SUBCELLUTAR LOCATION: Type I membrane protein.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This makes involved in downmodulation of cellular functions as the termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLE (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

SIMILARITY: Contains 2 immunoglobulin-like V-type domains.

SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.

molecules.
SUBUNIT: Homodimer; disulfide-linked. Interacts with PTPN6/SHP-1 and PTPN1/SHP-2 upon phosphorylation.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed by monocytic/myeloid lineage cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           480

spleen, liver and heart. Found at lower

levels in kidney and lung.

DOMAIN: Contains an intracytoplasmic motif referred as immunor-eceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular functions as the termination of the immune response. The phosphorylated ITIM motif binds to the SH2 domain of PTPN6/SHP-1 and PTPN11/SHP-2.

s SWISS-PROT entry is copyright. It is produced through a collaboration ween the Swiss Institute of Bioinformatics and the EMBL outstation - European Bioinformatics Institute. DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This is involved in downmodulation of cellular functions as the termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLI (STALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

SIMILARITY: Contains 1 immunoglobulin-like V-type domain.

SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SURFACE.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed by peripheral blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (neutrophils and monocytes but not eosinophils). Found in liver, fetal liver, bone marrow, placenta, spleen and in lower levels in skeletel muscle, fetal brain, stomach, lung, thymus, prostate,
                                                                                                                                                                                                                                       605640;

J. Biol. Chem. 274:28058-28058(1999).

-I- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Binds to alpha2,6-linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface.

-I- SUBCELLULAR LOCATION: Type I membrane protein (isoform 1);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04369; 015388; 043700;

                                                                                                                                                      TISSUE SPECIFICITY: Expressed at high levels in placenta and syncytictrophoblastic cells) and at lower levels in speripheral blood leukocytes (predominantly B-cells) and sintestine.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (TINM). This involved in downmodulation of cellular functions as the termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SI
                                                                              (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.
SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.

```
dependent binding to cells. Preferentially binds to alpha2, 3 and alpha2,6-linked sialic acid. Also binds distalogangliosides (distalogalactosyl globoside, distalyl lactotetraosylceramide and distalyl GalNAc lactotetraosylceramide). The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. In the immune response, may act as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via their SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules. Mediates inhibition of fignaling molecules. Mediates inhibits differentiation of CD34+ cell precursors towards myelomonocytic cell lineage and proliferation of leukemic myeloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vitale C., Romagnani C., Falco M., Ponte M., Vitale M., More Bacigalupo A., Moretta L., Mingari M.C.; "Engagement of p75/AIRM1 or CD33 inhibits the proliferation or leukemic myeloid cells.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION
                                                                                                                                                                                                                                       PTM: Tyrosine-phosphorylated.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLEC (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

SIMILARITY: Contains 1 immunoglobulin-like V-type domain.

SIMILARITY: Contains 2 immunoglobulin-like C2-type domains.

CAUTION: Ref. 3 sequence differs from that shown due to a frameshift in position 406.
                                                                                                                                                                                                                                                                                                                                                                                                Note=No experimental confirmation available;
TISSUE SPECIFICITY: Predominantly expressed by resting and activated natural killer cells and at lower levels by granulocytes and monocytes. High expression found in placenta, liver, lung, spleen, and peripheral blood leukocytes.

Spleen, and peripheral blood leukocytes.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular functions as the termination of the immune response. The phosphorylated ITIM motif binds to the SH2 domain of PTPN6/SHP-1.

DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This involved in downmodulation of cellular functions as the termination of the immune response.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SI (SIALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

SIMILARITY: Contains 3 immunoglobulin-like C2-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: Expressed by monocytic/myeloid lineage cells.
Found at high levels in peripheral blood leukocytes, spleen, bone marrow and at lower levels in lymph node, lung, appendix, placenta, pancreas and thymus. Expressed by monocytes and neutrophils but absent from leukemic cell lines representing earl

riverious Putative adhesion molecule of myslomonocytic-derived cells that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,6-linked sialic acid. The sialic acid recognition site may be masked by cis interactions with sialic acids on the same cell surface. In the immune response, mact as an inhibitory receptor upon ligand induced tyrosine phosphorylation by recruiting cytoplasmic phosphatase(s) via the SH2 domain(s) that block signal transduction through dephosphorylation of signaling molecules. Induces apoptosis in acute myeloid leukemia (in vitro).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   myeloid-specific sialic acid-binding receithe protein-tyrosine phosphatases, SHP-1

-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Monocytic/myeloid lineage cells.
-!- DOMAIN: Contains two copies of an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular functions as the binds to the SH2 domain of PTPNG/SHP-1 and/or PTPNIL/SHP-2.
-!- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLEC (SIALIC ACID BINDING IG-LIKE LECTIN) SUBERMAILY.
-!- SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
-!- DATABASE: NAME=PROW; NOTE=CD guide CD33 entry:

J. Biol. Chem. 276:45128-45136(2001).

-!- FUNCTION: Putative adhesion molecule that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,3-linked sialic acid. The sialic acid recognition site may be masked by cli interactions with sialic acids on the same cell surface.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Predominantly expressed by immature monocytic/myeloid lineage cells in both matrow. Also found at lower levels in mature neutrophils and monocytes.
-!- DOMAIN: Contains an intracytoplasmic motif referred as immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular functions as the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUNCTION: Putative adhesion molecule of myelomonocytic-derived cells that mediates sialic-acid dependent binding to cells. Preferentially binds to alpha2,6-linked sialic acid (By similarity). The sialic acid recognition site may be masked by interactions with sialic acids on the same cell surface. SUBCELLULAR LOCATION: Type I membrane protein. ALTERNATIVE PRODUCTS:

Preferentially binds to alpha? Ilinked stalle acid (By similarity).

11 SUBUNIT: Binds to RTN4R (By similarity).

12 SUBCELLULAR LOCATION: Type I membrane protein.

13 SUBCELLULAR LOCATION: Type I membrane protein.

14 SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. SIGLEC (STALIC ACID BINDING IG-LIKE LECTIN) SUBFAMILY.

15 SIMILARITY: Contains 4 immunoglobulin-like C2-type domains.

16 SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
